Section One

Introduction to the Model User Guide Requirements for transmitting insurance policy data

The IICMVA supports the use of the IICMVA Online Insurance Verification Model using web services technology and does not consider a data transfer process (often referred to as a Book of Business data transfer) to be part of the Online Insurance Verification Model.

However, the IICMVA also recognizes that a jurisdiction may want a one-time data file transfer to establish a current insurance company of record to associate with their registered vehicles. This process is intended for the express purpose of facilitating a jurisdiction's ability to send an online insurance verification query.

If a jurisdiction determines there is a need for insurance companies to provide additional insurance information, the IICMVA has established this guide which defines a standardized methodology and data file format for the consistent submission, implementation and use of the provided supplemental data.
