### 1. What this is - Track Changes Demo

An open-source WYSIWYG .docx editor for React. Drop in `<DocxEditor documentBuffer={file} />` and your users can open, edit, and save Word documents entirely in the browser — no backend required, no document data leaving the client.

Most editors serialise to HTML and back: `DOCX → HTML → edits → HTML → DOCX`. Every hop loses formatting, tracked changes, and styles. This library skips it — OOXML is the canonical format throughout.

```
import { DocxEditor } from '@eigenpal/docx-js-editor'
import '@eigenpal/docx-js-editor/styles.css'

function App({ file }: { file: ArrayBuffer }) {
  return (
    <DocxEditor
      documentBuffer={file}
      onSave={(buffer) => uploadToServer(buffer)}
    />
  )
}
```

### 2. Collaboration — Tracked Changes & Comments

Both features round-trip through OOXML so documents open correctly in Word, LibreOffice, and Google Docs.

Suggestion mode

Toggle between `Editing` and `Suggesting` via the toolbar dropdown. In `Suggesting` mode every edit becomes a tracked insertion (green underline) or deletion (red strikethrough). Consecutive keystrokes group into a single change. Accept or reject individually or all at once.

Serialises to `w:ins / w:del` — the same OOXML markup Word uses. Tracked changes survive a save/reload cycle and are reviewable in Word with full accept/reject UI.

Comments

Select text and click the floating button on the page edge to add a comment anchored to that selection. A Google Docs-style sidebar shows threaded cards positioned at their anchor point in the document. Reply, resolve, reopen, or delete inline.

Commented [1]: Just like that!

Serialises to `comments.xml` with `w:commentRangeStart / w:commentRangeEnd` markers. Comments and reply threads are preserved on round-trip.

Agent-friendly

Because tracked changes and comments are native OOXML, an AI agent can write `w:ins / w:del / w:comment` markup directly into a document and hand it to `<DocxEditor />` for human review — no custom diff format, no proprietary API.

3. Props

Pass `author="Your App"` to set the author name for comments and tracked changes. Toggle suggestion mode via the toolbar dropdown.

| Prop                        | Type                     | Default | Description                 |
|-----------------------------|--------------------------|---------|-----------------------------|
| <code>documentBuffer</code> | <code>ArrayBuffer</code> | —       | .docx file contents to load |

|                          |                       |                     |                                                   |
|--------------------------|-----------------------|---------------------|---------------------------------------------------|
| <code>readOnly</code>    | <code>boolean</code>  | <code>false</code>  | Preview mode — no editing UI                      |
| <code>showToolbar</code> | <code>boolean</code>  | <code>true</code>   | Show formatting toolbar                           |
| <code>author</code>      | <code>string</code>   | <code>'User'</code> | Author name for comments and tracked changes      |
| <code>onChange</code>    | <code>function</code> | —                   | Called on every document change                   |
| <code>onSave</code>      | <code>function</code> | —                   | Called on save, receives <code>ArrayBuffer</code> |
| <code>onError</code>     | <code>function</code> | —                   | Called on error                                   |
