Abstract –

The abstract must clearly describe the topic discussed in the article. State the problem and define the article's research question in one sentence. Summarize the novelties of this article. Give an outline of the research methods and data used in the study. Present empirical findings and write down the discussion in one or two sentences. Provide conclusions, implication, and contribution of your research.

Keywords: *keyword, keyword, keyword*

I. INTRODUCTION

The introduction gives the reader a glimpse of what will be presented. It is to grab the reader's attention by stimulating attention, interest, desire, and action. In other words, the introduction must effectively "sell" the manuscript. The introduction generally consists of a broad statement about the theme or topic of research, a summary of the available literature, and citations of the most important studies relevant to the current research; statements about controversies, gaps, and inconsistencies in the literature that will be discussed by this research; a statement about the problem/question to be discussed in the research, or research objectives. In the end, you can also state the outline of the structure of the article. (Times New Roman, 12 pt, space 1.5).

II. THEORY, LITERATURE REVIEW, AND HYPOTHESIS

To present a relevant theory for research purposes, a literature review presents gaps that will be exposed and solved and represent the theoretical core of an article. In this section, we will discuss the purpose of the literature review. We will also consider how one should search for appropriate literature on which to base a

literature review and how this information should be managed. Finally, we will answer questions that researchers often face when compiling a literature review. The hypothesis contains answers obtained during research and is developed based on the theory used and previous literature used. Also, present a research framework that describes the research model.

III. RESEARCH METHODS

Research methods are designed to describe the nature of the data. Methods should be well elaborated and improved, including models, approaches to analysis, and steps taken. Equations should be numbered as pictured. This section usually has the following sub-sections: Sampling (description of the target population, research context, and unit of analysis; sample; and profile of respondents); data collection; and size (or, alternatively, measurement). The research method should include the following: A brief description of the prevalence of this research method; the reasons for choosing a particular method are well explained; the accuracy of the research design is appropriate; the research sample is suitable; the data collection process is carried out correctly; and the relevance of data analysis methods is demonstrated.

IV. RESULTS AND DISCUSSION

To support their conclusion, authors must provide readers with enough information on the study results and the statistical analyses that were used. Furthermore, In the Discussion section, highlight the reasons for answering the question, "Why are the results like that?" It explains the theory and provides evidence of results. This section not only explains the numbers but also provides an in-depth analysis of the gaps it is trying to close. All figures and tables must be cited in the main text, such as Figure 1, Table 1, etc. Figures and tables are numbered sequentially with table titles and numbers above the tables/figures. The table must be centered in a column or on the page. Tables must be followed by a space. Table elements must be single-spaced, but double-spacing can be used to indicate grouping data or to separate sections in a table. Tables are referred to in the text by table numbers. for example, in Table 1. Do not display vertical lines in the table. There are only horizontal lines displayed

in the table.

V. FINDINGS AND CONCLUSION

In this section, the authors present a brief conclusion of the research results with suggestions for advanced researchers or general readers. A conclusion may cover the main points of the article, but don't replicate the abstract in the conclusion. Researchers must explain the empirical and theoretical benefits, the economic benefits, and the existence of any new findings. This section should not merely restate the findings reported in the result section or report additional findings that have not been discussed earlier in the article.

You may assume that the reader has a working knowledge of basic statistics (i.e., typically the contents covered in a first statistics course). It is, therefore, not necessary to discuss basic statistical procedures in detail. You may, however, have to explain advanced multivariate statistical methods (e.g., repeated-measures ANOVA, two- or three-way ANOVA, multiple regression analysis, and factor analysis) in non-technical terms. Figures and tables (detached from the main body of the manuscript) often allow one to present findings in a clear and concise manner.

Example:

Table 1.

Title.....

Section and Topic	Item #	Checklist item
TITLE		
Title	4	Identify the report as a systematic review.
ABSTRACT		

Column 1	Column 2	Column 2	Column 2	Column 2	Page 2
Abstract		See the PRISMA 2020 for Abstracts checklist.			
Font size: 11px	INTRODUCTION		0.xxx	0.xxx1	0.xxx2
Abcde2	Rationale	0.yyyy1 Describe the rationale for the review in the context of existing knowledge.	0.yyyy2	Page 3	
Abcde3	Objectives	0.zzz1 Provide an explicit statement of the objective(s) or question(s) the review addresses.	0.zzz2	Page 3	
Abcde4	METHODS		0.aaaa	0.aaaa1	0.aaaa2

Eligibility criteria–	5	Specify the inclusion and exclusion criteria for the review and how studies were grouped for the synthesis.
Information–sources–	6	Specify all databases, registers, websites, organisations, reference lists and other sources searched or consulted, and the date when each source was last searched or consulted.
Search strategy	7	Present the full search strategies for all databases, registers and websites, including any filters and limits.
Selection process	8	Specify the methods used to decide whether a study met the inclusion criteria of the review, including how many records and each report retrieved, whether they worked independently, and if applicable, details of automation tools used.
Data collection–process–	9	Specify the methods used to collect data from reports, including how many reviewers collected data from each report, whether they worked independently, any processes for obtaining or confirming data from study investigators, and if applicable, details of automation tools used.
Data items–	10a	List and define all outcomes for which data were sought. Specify whether all results that were compatible with each study were sought (e.g. for all measures, time points, analyses), and if not, the methods used to decide which results were reported.
	10b	List and define all other variables for which data were sought (e.g. participant and intervention characteristics, confounding factors, effect modifiers, and any assumptions made about any missing or unclear information).
Study risk of bias–assessment	11	Specify the methods used to assess risk of bias in the included studies, including details of the tool(s) used, whether they worked independently, and if applicable, details of automation tools used.
Effect measures–	12	Specify for each outcome the effect measure(s) (e.g. risk ratio, mean difference) used in the synthesis and how they were calculated.
Synthesis–methods	13a	Describe the processes used to decide which studies were eligible for each synthesis (e.g. tabulating the characteristics of each study and comparing against the planned groups for each synthesis (item #5)).
	13b	Describe any methods required to prepare the data for presentation or synthesis, such as handling of missing data, conversions, etc.
	13c	Describe any methods used to tabulate or visually display results of individual studies and syntheses.
	13d	Describe any methods used to synthesize results and provide a rationale for the choice(s). If meta-analysis was done, describe the model(s), method(s) to identify the presence and extent of statistical heterogeneity, and software packages used.
	13e	Describe any methods used to explore possible causes of heterogeneity among study results (e.g. subgroup analyses).
	13f	Describe any sensitivity analyses conducted to assess robustness of the synthesized results.
Reporting bias–assessment	14	Describe any methods used to assess risk of bias due to missing results in a synthesis (arising from reporting bias).
Certainty–assessment	15	Describe any methods used to assess certainty (or confidence) in the body of evidence for an outcome.
RESULTS		
Study selection–	16a	Describe the results of the search and selection process, from the number of records identified in the search to the number of records screened, included in the review, ideally using a flow diagram.
	16b	Cite studies that might appear to meet the inclusion criteria, but which were excluded, and explain why.
Study–characteristics–	17	Cite each included study and present its characteristics.
Risk of bias in–studies–	18	Present assessments of risk of bias for each included study.
Results of–individual studies–	19	For all outcomes, present, for each study: (a) summary statistics for each group (where appropriate) and measures of precision (e.g. confidence/credible interval), ideally using structured tables or plots.
Results of–syntheses	20a	For each synthesis, briefly summarise the characteristics and risk of bias among contributing studies.
	20b	Present results of all statistical syntheses conducted. If meta-analysis was done, present for each the summary estimate (e.g. confidence/credible interval) and measures of statistical heterogeneity. If comparing groups, describe the direction and magnitude of any differences between groups.
	20c	Present results of all investigations of possible causes of heterogeneity among study results.
	20d	Present results of all sensitivity analyses conducted to assess the robustness of the synthesized results.
Reporting biases	21	Present assessments of risk of bias due to missing results (arising from reporting biases) for each synthesis.
Certainty of–evidence–	22	Present assessments of certainty (or confidence) in the body of evidence for each outcome assessed.
DISCUSSION		
Discussion–	23a	Provide a general interpretation of the results in the context of other evidence.

	23b	Discuss any limitations of the evidence included in the review.
	23c	Discuss any limitations of the review processes used.
	23d	Discuss implications of the results for practice, policy, and future research.
OTHER INFORMATION		
Registration and protocol	24a	Provide registration information for the review, including register name and registration number, or state that no registration was required.
	24b	Indicate where the review protocol can be accessed, or state that a protocol was not prepared.
	24c	Describe and explain any amendments to information provided at registration or in the protocol.
Support	25	Describe sources of financial or non-financial support for the review, and the role of the funders or sponsors.
Competing interests	26	Declare any competing interests of review authors.
Availability of data, code and other materials	27	Report which of the following are publicly available and where they can be found: template data collection forms; data used for all analyses; analytic code; any other materials used in the review.

Figure 1, Title

VI. IMPLICATIONS, LIMITATIONS AND SUGGESTIONS

The author must present the main deficiencies and limitations of the study, which may reduce the validity of the paper, thereby raising questions from the reader about whether or in what way the limitations of the study may have influenced the results and conclusions. Limitations require critical assessment and interpretation of their research impact. The author must provide an answer to the question: Is this a problem caused by an error or in the chosen method, validity, or something else?

Reference

In writing the reference refers to the output of the APA Style. This web link <https://bowvalleycollege.libguides.com/apa-style/article-nodoi> , which describes APA

citations can be useful. Please use the Reference Application Managers like EndNote , Mendeley , Zotero , etc . The use of DOI is highly recommended. The reference style used by the journal will be applied to articles received by the Editor at the proofing stage. Note that missing data will be highlighted at the proof stage for the authors to correct. Please make sure that any references cited in the text are also in the list of references (and vice versa). Unpublished results and private communications are not recommended in reference lists, but may be mentioned in the text. Use other published articles in the same journal as the model. All publications cited in the text must be included as a reference list. The reference list is listed alphabetically. Please make sure that any references cited in the text are also in the list of references (and vice versa). *For any questions, please contact the journal's editorial office, and see the examples below.*
