

Travels with Anzie – Sagrada Familia

March 2020

I first discovered Antoni Gaudi in 1994 during a business trip to Barcelona. My hosts showed me a few of his architectural wonders. I became immediately enthralled with the organic features: a dragon back for a roof line, balconies shaped like turtles, mosaic lizards instead of gargoyles, on and on. I was astounded by the fact that he designed these modernist features in the early part of the 20th Century.

Sagrada Familia is his most famous and awe-inspiring work. This church (actually a basilica) was begun in 1882 and is still unfinished. How to describe it. Much of it appears to be melting. Remember the Mason Williams song made famous in the 70's? "Someone left the cake out in the rain ...". Did you ever make a drip sandcastle at the beach? Both of these give you a pretty good idea of S.F.'s exterior organic appearance.

When construction began, the design was to be a Gothic-revival style. The original architect quit in the second year, and Gaudi took over. He completely redesigned it. Although still basically Gothic, Gaudi added his own Art Nouveau/Modernisme touches. All the statuary rests on the exterior. There are no exterior buttresses; the supports are all inside in the form of magnificent stone tree-like structures, including leaves, sunflowers and birds. There are eight 330-foot spires, topped with crosses. They will be joined by ten more before it is finished. One of them will be the 560-foot Jesus tower. The church is designed to hold up to 8000 worshippers. The stained-glass windows, which cover a good portion of the walls, are abstract. Starting from the base in blue, then purple, green, yellow, red, finally orange, sunlight gives a veritable symphony of light to the interior.

Gaudi was hit by a streetcar and died in 1925. He knew he wasn't going to live to see the completion, and he planned accordingly. He was supposed to have said, "My client (God) is not in a hurry". He made several models and drew countless plans, which he left as his legacy. The current goal is completion by 2026, the centennial anniversary of Gaudi's death.

So, what's taking so long? Is this the normal pace of construction projects in Catalonia? Certainly funding is always a problem. Tourists pay a minimum of about \$19 each to tour the church. A good portion of that goes toward the construction. So, each tourist can be proud that he or she is contributing to this awesome project.

Work was delayed for a time after Gaudi's death. In 1936-39 work was halted by the Spanish Civil War. The crypt was burned along with many of Gaudi's plans. Building didn't really resume in earnest until the 1950's. In the 1980's computer technology began to help speed up the pace.

The roof was finally enclosed in 2010, just in time for Pope Benedict XVI arrival to dedicate the church as a basilica.

If you examine the intricate detail on the exterior, you can perhaps understand why things took so long. What you see over the entrances is a series of cement grottoes peopled with biblical figures.

Anzie and I have visited Barcelona several times over the years. Except for a drive-by, this was our first real visit to this truly amazing site. Here's hoping we live long enough to see it finished.

Hasta la proxima,

Chuck & Anzie

5 advantages of using oxygen generators for water treatment

Nothing is more important to the life of every living thing on this planet than water. Access to clean water is a stepping stone to development. If people have access to clean water, they will be able to practice good sanitation and hygiene. However, access to clean water is becoming more difficult every day due to the increasing consumption of water worldwide. People are going to great lengths to obtain the quality and quantity of water they need to cook, drink, bathe, wash and grow food.

To get clean water, — water oxygenation is the best treatment. Injecting oxygen into your water system can amplify the impact by removing impurities and contaminants from your water supply.

How does an oxygenator help recycle wastewater?

Making wastewater reusable is a time-consuming process because the water needs to be biodegraded. Since biodegradation takes place with the help of bacteria, — there is a foul odor and harmful chemical gases such as methane gas and hydrogen sulfide are produced. To avoid the pungent odor and harmful chemicals, — using oxygen to feed the bacteria is the highest strategy.

5 advantages of using oxygen generators for water treatment

Apart from avoiding bad odors and unsafe gases, — oxygen generators have some other advantages as well. The advantages mentioned below will demonstrate why water oxygenation is the best.

1. You can avoid high sewage treatment fees — Just as there is a charge for consuming clean water, — there is also a charge for wasting water. Treating wastewater increases the cost to the consumer. Getting an oxygen generator is a wise decision for everyone who wants to reduce the cost of wastewater treatment because of the low cost and output of the generator.

2. Affordable — Having an oxygen generator is self-sufficient because it frees the user from never-ending bills and the worry of obtaining oxygen produced at low temperatures. These generators require low energy, — resulting in low cost.

3. Zero Maintenance — XITE oxygen generators can be maintained without any technical expertise or complex training. In addition, — there is virtually no need to repair the machine.

4、Produce high purity gas - XITE on-site oxygen generators produce oxygen with a purity higher than 95%.

5、Very easy to use and fast - Compared to other methods, the practice of oxygenation of water bodies is not complicated and fast.

To get the perfect water treatment system for your needs, please send your inquiry and we will tell you about our oxygenator options.
