

OOXML w:color tester – direct values (hex/auto/theme), rStyle-only, inline overrides, and linked styles with theme tint/shade examples.

A) Direct <w:color> variants on runs:

- w:color hex FF0000 (red): Color sample text
- w:color hex 00AA00 (green): Color sample text
- w:color hex 0000FF (blue): Color sample text
- w:color auto: Color sample text
- w:color theme accent1: Color sample text
- w:color theme accent2: Color sample text
- w:color theme accent3: Color sample text
- w:color theme accent4: Color sample text
- w:color theme accent5: Color sample text
- w:color theme accent6: Color sample text
- w:color theme hyperlink: Color sample text
- w:color theme followedHyperlink: Color sample text
- w:color theme accent1 + tint 99: Color sample text
- w:color theme accent1 + shade 33: Color sample text

B) rStyle-only color (no inline <w:color>):

- rStyle='SD_ColorRedChar' (red): Styled red text
- rStyle='SD_ColorAccent2Char' (theme accent2): Styled theme accent2 text
- rStyle='SD_ColorAutoChar' (auto): Styled auto color text

C) rStyle + inline <w:color> (inline overrides style):

- rStyle='SD_ColorAccent2Char' + inline hex FF0000 => expect red: Accent2 style overridden by inline red

- rStyle='SD_ColorRedChar' + inline auto => expect auto color: Red style overridden by inline auto

D) Linked style pair (paragraph+character) with theme colors:

- rStyle='SD_LinkedColorHeadingChar' => magenta: Linked Char style applied

- rStyle='SD_LinkedColorHeadingChar' + inline theme accent1 => expect accent1: Inline theme overrides char style color

- pStyle='SD_LinkedColorHeading' (accent1) + inline hex 0000FF on a run: This part should be blue (0000FF) overriding paragraph theme

Table examples (mixed color sources):

rStyle=Accent2

Theme accent2

rStyle=Red + inline auto

Should be auto color

Images

Images can be of three main types. Inline images are images that are part of the normal text flow, like this image of a green dot . Inline images do not cause breaks in the text and are usually small in size. The next category of image is a floating image, one that “floats” on the page and is surrounded by text. Word supports more types of floating images than are possible with current ebook technology, so the conversion maps floating images to simple left and right floats, as you can see with the left and right arrow images on the sides of this paragraph.

The final type of image is a “block” image, one that becomes a paragraph on its own and has no text on either side. Below is a centered green dot.

Centered images like this are useful for large pictures that should be a focus of attention.

Generally, it is not possible to translate the exact positioning of images from a Word document to an ebook. That is because in Word, image positioning is specified in absolute units from the page boundaries. There is no analogous technology in ebooks, so the conversion will usually end up placing the image either centered or floating close to the point in the text where it was *inserted*, not necessarily where it appears on the page in Word.
